CMYK

RGB

Here are the logos without a background fill. The top row is CMYK and the bottom row is RGB. You wont be able to tell the difference until you print the two. Usually how that works is how you save the colors in the file. A file saved in RGB will print different than a file in CMYK. RGB is dominantly used for online use and CMYK is used for print. (There is your lesson for the day).
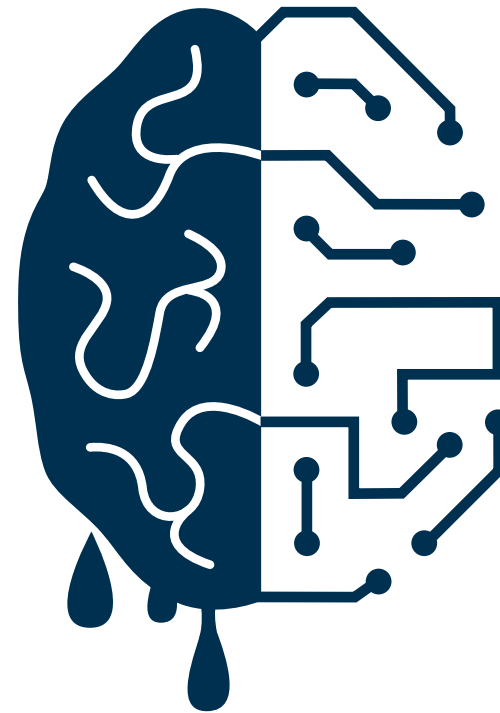

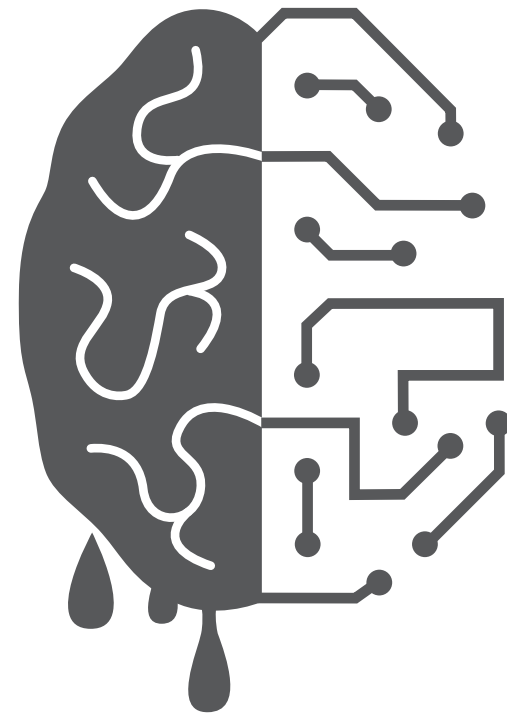

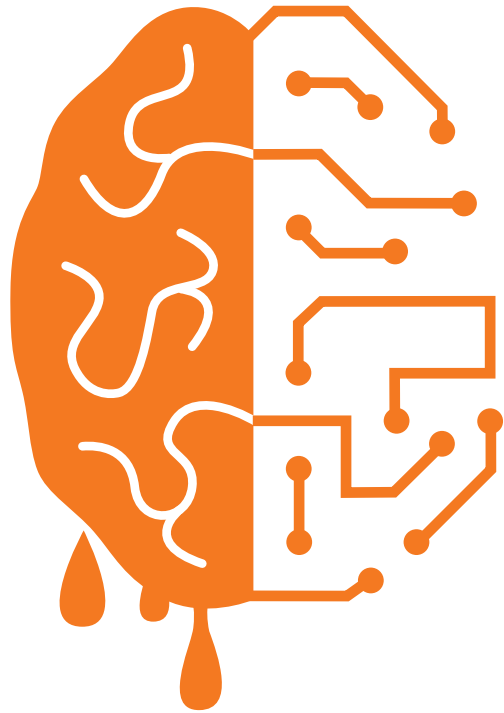

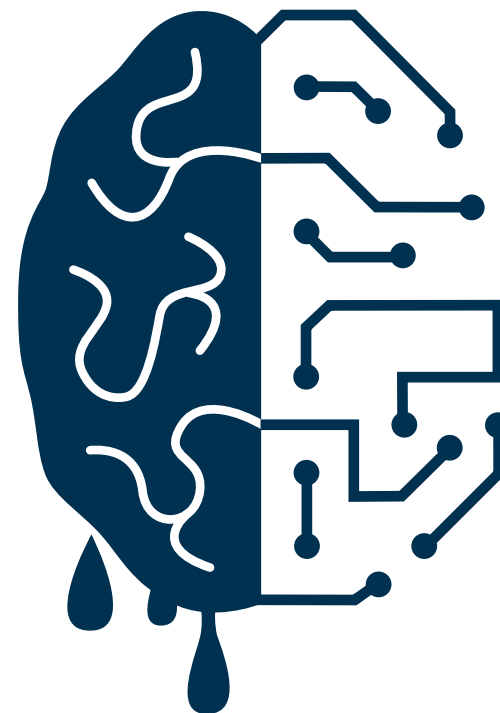

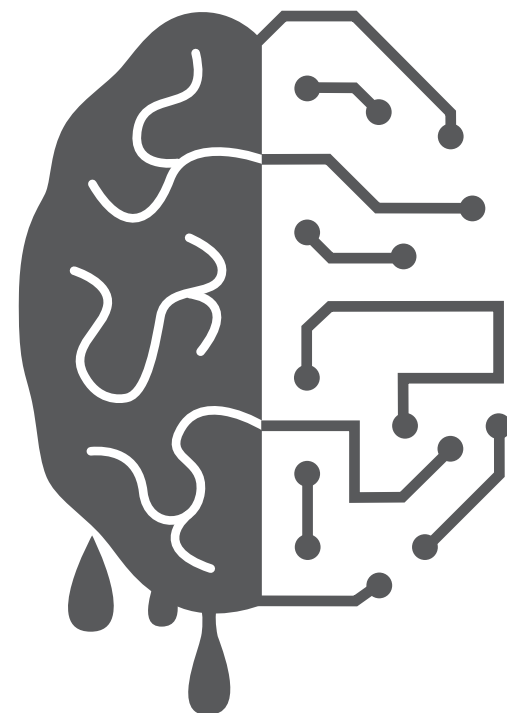

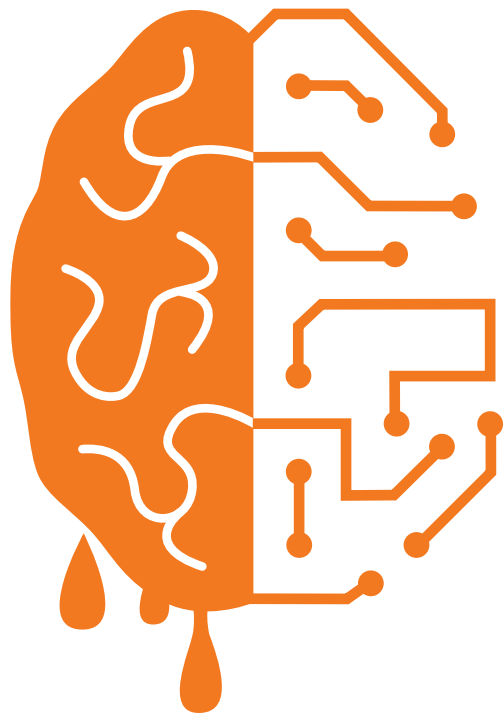

These are mockup business cards. Just you give an idea how they will look in application and whatnot.
